

The current state of emissions in the Inner West

Inner West Council emissions

Council's activities generate approximately 22 kilotonnes (kt) of CO₂-each year. The vast majority relates to the consumption of fuel, gas and electricity, which together accounts for over 93% of emissions. This is equivalent to the electricity use of around 5,000 Inner West households each year, or 2% of Inner West community's emissions.
